

provide `count` and `datatype` arguments that specify the same type signature (i.e., it is not necessary that both groups provide the same `count` value).

7. Section 6.3.1 on page 186.

`MPI_GROUP_TRANSLATE_RANKS` and `MPI_PROC_NULL`: `MPI_PROC_NULL` is a valid rank for input to `MPI_GROUP_TRANSLATE_RANKS`, which returns `MPI_PROC_NULL` as the translated rank.

8. Section 6.7 on page 221.

About the attribute caching functions:

*Advice to implementors.* High-quality implementations should raise an error when a keyval that was created by a call to `MPI_XXX_CREATE_KEYVAL` is used with an object of the wrong type with a call to `MPI_YYY_GET_ATTR`, `MPI_YYY_SET_ATTR`, `MPI_YYY_DELETE_ATTR`, or `MPI_YYY_FREE_KEYVAL`. To do so, it is necessary to maintain, with each keyval, information on the type of the associated user function. (*End of advice to implementors.*)

9. Section 6.8 on page 235.

In `MPI_COMM_GET_NAME`: In C, a null character is additionally stored at `name[resultlen]`. `resultlen` cannot be larger than `MPI_MAX_OBJECT_NAME-1`. In Fortran, `name` is padded on the right with blank characters. `resultlen` cannot be larger than `MPI_MAX_OBJECT_NAME`.

10. Section 7.4 on page 243.

About `MPI_GRAPH_CREATE` and `MPI_CART_CREATE`: All input arguments must have identical values on all processes of the group of `comm_old`.

11. Section ?? on page ??.

In `MPI_CART_CREATE`: If `ndims` is zero then a zero-dimensional Cartesian topology is created. The call is erroneous if it specifies a grid that is larger than the group size or if `ndims` is negative.

12. Section 7.5.3 on page 246.

In `MPI_GRAPH_CREATE`: If the graph is empty, i.e., `nnodes == 0`, then `MPI_COMM_NULL` is returned in all processes.

13. Section 7.5.3 on page 246.

In `MPI_GRAPH_CREATE`: A single process is allowed to be defined multiple times in the list of neighbors of a process (i.e., there may be multiple edges between two processes). A process is also allowed to be a neighbor to itself (i.e., a self loop in the graph). The adjacency matrix is allowed to be non-symmetric.

*Advice to users.* Performance implications of using multiple edges or a non-symmetric adjacency matrix are not defined. The definition of a node-neighbor edge does not imply a direction of the communication. (*End of advice to users.*)

14. Section 7.5.4 on page 248.

In `MPI_CARTDIM_GET` and `MPI_CART_GET`: If `comm` is associated with a zero-dimensional Cartesian topology, `MPI_CARTDIM_GET` returns `ndims=0` and `MPI_CART_GET` will keep all output arguments unchanged.
