

The MPI interface provides four communicator construction routines that apply to both intracommunicators and intercommunicators. The construction routine `MPI_INTERCOMM_CREATE` (discussed later) applies only to intercommunicators.

An intracommunicator involves a single group while an intercommunicator involves two groups. Where the following discussions address intercommunicator semantics, the two groups in an intercommunicator are called the *left* and *right* groups. A process in an intercommunicator is a member of either the left or the right group. From the point of view of that process, the group that the process is a member of is called the *local* group; the other group (relative to that process) is the *remote* group. The left and right group labels give us a way to describe the two groups in an intercommunicator that is not relative to any particular process (as the local and remote groups are).

`MPI_COMM_DUP` Duplicates the existing communicator `comm` with associated key values. For each key value, the respective copy callback function determines the attribute value
