

of an `MPI_COMM_FREE` on `MPI_COMM_SELF`. This will cause the delete callback function to be executed on all keys associated with `MPI_COMM_SELF`, *[in an arbitrary order]in the reverse order that they were set on `MPI_COMM_SELF`*. If no key has been attached to `MPI_COMM_SELF`, then no callback is invoked. The “freeing” of `MPI_COMM_SELF` occurs before any other parts of MPI are affected. Thus, for example, calling `MPI_FINALIZED` will return `false` in any of these callback functions. Once done with `MPI_COMM_SELF`, the order and rest of the actions taken by `MPI_FINALIZE` is not specified.

ticket71.

Advice to implementors. Since attributes can be added from any supported language, the MPI implementation needs to remember the creating language so the correct callback is made. *Implementations that use the attribute delete callback on `MPI_COMM_SELF` internally should register their internal callbacks before returning from `MPI_INIT` / `MPI_INIT_THREAD`, so that libraries or applications will not have portions of the MPI implementation shut down before the application-level callbacks are made.* (*End of advice to implementors.*)

ticket71.

8.7.2 Determining Whether MPI Has Finished

One of the goals of MPI was to allow for layered libraries. In order for a library to do this cleanly, it needs to know if MPI is active. In MPI the function `MPI_INITIALIZED` was provided to tell if MPI had been initialized. The problem arises in knowing if MPI has been finalized. Once MPI has been finalized it is no longer active and cannot be restarted. A library needs to be able to determine this to act accordingly. To achieve this the following function is needed:

`MPI_FINALIZED(flag)`

OUT flag true if MPI was finalized (logical)

`int MPI_Finalized(int *flag)`

`MPI_FINALIZED(FLAG, IERROR)`

LOGICAL FLAG

INTEGER IERROR

`{bool MPI::Is_finalized() (binding deprecated, see Section 15.2) }`

This routine returns `true` if `MPI_FINALIZE` has completed. It is legal to call `MPI_FINALIZED` before `MPI_INIT` and after `MPI_FINALIZE`.

Advice to users. MPI is “active” and it is thus safe to call MPI functions if `MPI_INIT` has completed and `MPI_FINALIZE` has not completed. If a library has no other way of knowing whether MPI is active or not, then it can use `MPI_INITIALIZED` and `MPI_FINALIZED` to determine this. For example, MPI is “active” in callback functions that are invoked during `MPI_FINALIZE`. (*End of advice to users.*)
